

September Charm Anemone
Anemone x hybrida 'September Charm'

Plant Height: 3 feet

Flower Height: 4 feet

Spread: 3 feet

Sunlight: ☉ ●

Hardiness Zone: 4a

Other Names: Japanese Anemone

Description:

Soft-pink buttercup flowers rise high above dark green foliage; windflowers are perfect for naturalizing, swaying gently in the wind and blooming at the end of the season; impressive when massed

Ornamental Features

September Charm Anemone is smothered in stunning semi-double shell pink buttercup flowers with yellow eyes at the ends of the stems from late summer to early fall. The flowers are excellent for cutting. Its lobed leaves remain dark green in colour throughout the season.

Landscape Attributes

September Charm Anemone is a dense herbaceous perennial with an upright spreading habit of growth. Its relatively fine texture sets it apart from other garden plants with less refined foliage.

This is a relatively low maintenance plant, and is best cleaned up in early spring before it resumes active growth for the season. It is a good choice for attracting bees and butterflies to your yard, but is not particularly attractive to deer who tend to leave it alone in favor of tastier treats. It has no significant negative characteristics.

September Charm Anemone is recommended for the following landscape applications;

- Mass Planting
- General Garden Use

Planting & Growing

September Charm Anemone will grow to be about 3 feet tall at maturity extending to 4 feet tall with the flowers, with a spread of 3 feet. Its foliage tends to remain dense right to the ground, not requiring facer plants in front. It grows at a medium rate, and under ideal conditions can be expected to live for approximately 10 years. As an herbaceous perennial, this plant will usually die back to the crown each winter, and will regrow from the base each spring. Be careful not to disturb the crown in late winter when it may not be readily seen!

This plant does best in full sun to partial shade. You may want to keep it away from hot, dry locations that receive direct afternoon sun or which get reflected sunlight, such as against the south side of a white wall. It prefers to grow in average to moist conditions, and shouldn't be allowed to dry out. It is not particular as to soil type or pH. It is somewhat tolerant of urban pollution. Consider applying a thick mulch around the root zone in both summer and winter to conserve soil moisture and protect it in exposed locations or colder microclimates. This particular variety is an interspecific hybrid. It can be propagated by division; however, as a cultivated variety, be aware that it may be subject to certain restrictions or prohibitions on propagation.
